

Supplementary information to Structural and Electrical Properties of Lithium Substituted Niobo Vanadate Glasses Doped with Nickel Ferrite

This supplementary information contains the details of basic characterization of VNL glasses and Nickel Ferrite as well as tables of various parameters used to fit the Cole-Cole representation of impedance data.

S1. Physical property measurements and characterization:

Density of the prepared glasses were determined using the Archimedes principle, to an accuracy of ± 0.004 g/cc. Xylene was used as an immersion liquid with a density of 0.864 g/cc (declared by the manufacturer). A high resolution electronic weighing balance (with an accuracy of 0.0001 g) was used to measure the weights of the samples in air and liquid. The

molar volume was calculated using the equation $V_m = \frac{M}{\rho}$, where M is the molecular weight

of the glass sample, which was calculated as $M = \sum x_i w_i$, where x_i and w_i are the mole fraction and molecular weight of the component i and ρ is the density, respectively. The values are listed in Table 1 in the main manuscript.

The concentration of alkali ions in the general formula $x\%A_bB_c$: ($x\%Li_2O$) can be calculated

from $n(A) = \frac{b x N}{100 V_m}$, where, x , N and V_m are mole percentage, Avogadro number and molar

volume, respectively. The separation between like ions was calculated using the formula

$r = (1/n)^{1/3}$. The distance between Li and O was calculated by assuming that O lies at half distance between two Li atoms.

S2 EPR of VNL glasses:

The oxidation state of vanadium in the glass was confirmed by EPR measurement of the glass. The absence of vanadium hyperfine signature confirms that the vanadium is in V^{5+} state i.e., it forms a VO_5 structure. Fig.S1 shows the EPR spectra of un-doped and Nickel Ferrite doped glasses. The central broad absorption is because of the cavity resonance. The central absorption at around 3360.20 G and 3350.15 G. for VNL 15 and VNLFe 15, respectively. The sharp absorption at around 3491.09 and 1723.07 G for VNL is the signature of DPPH which is used as reference.

Fig. S1 (a) and (b) EPR of VNL 15 and VNLFe 15 (VNL 15 doped with Nickel Ferrite.)

S3 Characterization of Nickel Ferrite:

S3.1 XRD of Nickel Ferrite (NF)

The XRD of NF ($NiFe_2O_4$) is shown in Fig.S2. The crystal structure and particle size of nano

particles have been investigated using Scherer's relation using equation $D = \frac{K\lambda}{\beta \cos \theta}$

where λ is the wavelength of X-ray diffraction (1.5406 Å), K is a constant taken as 0.89, θ is the diffraction angle and β is the full width half maximum (FWHM) [S1]. The crystallite size was calculated and the average crystallite size was found to be 51 nm.

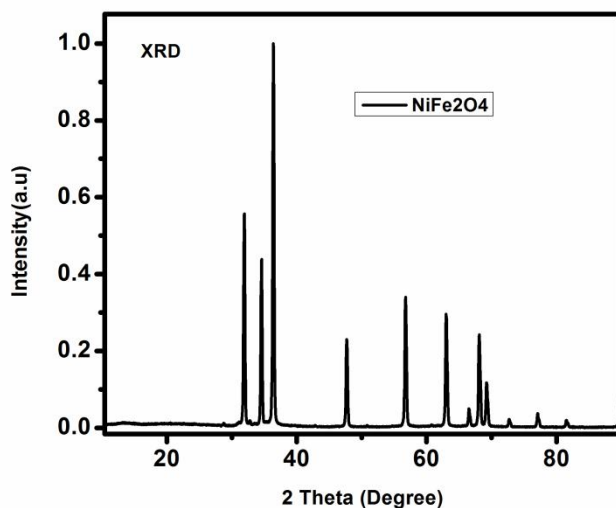

Fig. S2: XRD of Nickel Ferrite

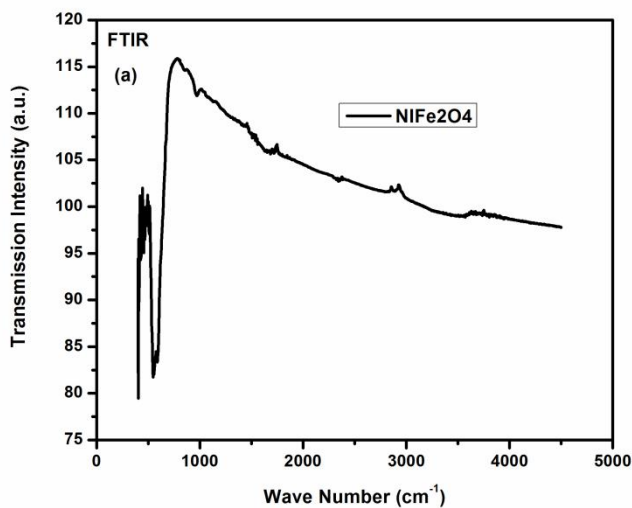

Fig. S3: FTIR of Nickel Ferrite

S3.2 SEM of Nickel Ferrite (NF)

Microstructural information of NiFe_2O_4 (NF) was obtained using scanning electron microscopy (SEM). Field emission scanning electron microscopy was used at different magnifications to obtain a representative crystallite size and separation distance between pores in the synthesized nickel ferrite. The sample was examined at an accelerating voltage of 5 kV. The entire set-up was interfaced with a computer which enabled the direct recording of micrographs. The SEM information of nickel ferrite (NiFe_2O_4) is shown in Fig.6. As can be seen from Fig.6 the sample is uniform, almost spherical structural morphology with narrow size distribution but with agglomeration to some extent.

Fig. S4 : SEM Images of Nickel Ferrite (NiFe₂O₄)

S4 Tables and values of various parameters used in fitting the equivalent circuit elements to Cole-Cole plots. The meaning of the symbols and the significance are discussed in the main text.

Table S1: (a) Parameters used to fit measured Cole-Cole plot of **VNL 15** using two RC circuits ($R_s+C_1/R_1+C_2/R_2$): Inadequate fitting

| Temperature (°C) | $R_s(\Omega)$ | $C_1(F)$ | $R_1(k\Omega)$ | $C_2(F)$ | $R_2(k\Omega)$ |
|------------------|---------------|-------------------------|----------------|-------------------------|----------------|
| VNL 15 | | | | | |
| 120 | 602.8 | 4.481×10^{-12} | 89.18 | 1.076×10^{-9} | 52.89 |
